## Photoshop 2020 (version 21)

Large quantities of a material which may be in the form of crystals, powder, beads, or other irregularly shaped particles, are frequently produced in situations in which the material is not handled in bulk form but is used instead in very small quantities. For example, materials such as magnetic and piezoelectric powders used in the electronic field are delivered and used in very small quantities and, if the materials are mixed together, the mixture is conveyed in a form which is far from being homogeneous. One of the techniques most often used to handle such powders in a homogeneous form consists in placing one or more quantities of powder in chambers which are conveyed in a suitable device. The powder contained in the chambers is thus separated from the air and any other contaminating material, conveyed without any free fall and finally discharged into a bin from which the powder can be retrieved. The quantity of powder present in the chamber is determined by the type of device used (e.g. a vibrating chamber or an aspirator). The frequency and amplitude of vibration for these two types of devices are different, in order to obtain a desired flow rate. For producing the vibrating chamber, the user can use either an apparatus described in French patent FR-A-2 632 850 or in a version of the latter described in European patent EP-A-0 789 688. In both cases, an apparatus or machine for producing and vibrating chambers of different sizes is used to obtain the desired size of the powder flow. The purpose of this invention is to provide an apparatus, in particular of modular construction, which makes it possible to produce chambers of the same type, and which makes it possible to produce chambers of different sizes with a single machine. Thus, an objective of the present invention is to provide an apparatus for filling a vibrating chamber, the apparatus comprising a chamber filling head supported by a movable arm, characterized in that it comprises a horizontal hopper for powder or granular material which is arranged vertically above the filling head and which comprises at least one vibrating device equipped with a vibrator and a screen or filter comprising an upper wall and an opening having a cross-section smaller than that of the screen or filter. The document DE-A-3 909 099 describes a vibrator which, using a sinusoidal excitation, produces one or more packets of an elastic mass under pressure. In this case, the vibrator can be a vibrating head. Finally, the document EP

## What's New In?

**Brush Tool**. Use the Brush Tool to paint over areas on your photo to create textured, customized backgrounds or the look of age on an image. For example, you can use the Brush Tool to paint tiny flowers on a birthday cake. **Color Replacement**. The Color Replacement tool lets you replace one color with another to darken or lighten areas of an image. For example, if you're trying to give a dark brown car a color wash, you can use this tool to add color to a dark brown area of the car. The Paint Bucket is used to create a new layer of pixels on your photo. This is the only tool that creates \_black\_ pixels in a file. (Most Photoshop programs, by default, don't show white pixels, making it difficult to see where you're editing.) The Pen tool has three choices: Pencil, Brush, and Pen. For more on using the Pen tool, see the box on Pen & Ink Tools. You can use Layer Masks to keep certain areas of an image from being edited. Just select the appropriate layer and use the Layer Mask icon (the tiny paint-brush icon) in the Layers panel. You can only edit the part of the layer that is showing. The layer is \_masked\_ — you can't see its background. Note that if you use the Brush tool to paint in a mask, the tool's Brush Control panel comes open so you can see the background colors of the image that's being covered. In other words, the Brush tool is not compatible with layer masks. # Creating New Layers In addition to the options available with the Quick Mask and Pen tools, Photoshop gives you several other ways to work with layers. You can create a new layer whenever you like by pressing Shift+Backspace or right-clicking (Mac) or Ctrl+Backspace (Windows). You can also use the Layer menu or the Layer commands described below to create layers. In this section, we'll look at creating new layers and organizing them. As with channels in a RAW file, Photoshop layers are invisible, so when you create them, you're working with the hidden layers behind the visible ones. When you create a new layer, you're giving the file a new name and cutting the visible layer off the background. The new layer is made visible by default, so you can see and edit it.
