Photoshop Features The features of Photoshop are manifold. They include, but are not limited to: - Content-aware editing (Layer Masking) - Multi-camera support - Image manipulation - Smart Objects - Live-editing - Filter Creation - Movie making - File formats - Vector drawing - Branding - Animation Photoshop provides a lot of functionality. However, you don't need all of these features to be productive. The following are only a selection of the features that may be useful to you and will be discussed.

The Photoshop Interface Photoshop's interface is fairly simple, and most of the features can be operated with just a few clicks of the mouse. Because the interface is based on the concept of layers, it is simple to use. The menu bar at the top of the window provides access to all Photoshop tools. In the upper right corner, you'll notice the button that allows you to open files. The Image menu provides access to all tools that modify images, such as brightness and contrast, photo retouching, color correction, and others. The main purpose of the Image menu is to allow you to select the type of change that you want to make. The Artwork menu is handy when you're working on artwork. Some of the tools are more applicable to artwork than others. For example, Vector tools such as Bézier Path and the Lasso tool make it easier to create and modify vector artwork. The Layers menu allows you to create layers and make selections (see Chapter 2). When you're working in Photoshop, you'll spend a lot of time working with layers. From this menu you can create new layers as well as move or duplicate existing layers. You can also adjust the opacity and delete layers. The Select menu provides several options, such as Selection, Lasso, Eyedropper, and Color Range

A typical conventional gas treatment system for removing harmful gases such as carbon monoxide (CO) and NO_x from an exhaust gas contains an air injection device having an injector nozzle, a first partition wall surrounding the injector nozzle and defining the upstream and downstream gas flow passages therein, and an air supply conduit for supplying air to the upstream gas flow passage defined by the first partition wall. An air filter is disposed in the air supply conduit and configured to remove solid impurities in the air passing through the air supply conduit. Upon combustion of gaseous fuel in a burner, an exhaust gas is generated, which flows from the burner and passes through the first partition wall, through the injector nozzle and into the second partition wall. The oxygen in the air supplied to the upstream gas flow passage is injected around the upstream side of the injector nozzle through the injector nozzle and imparts swirling flow to the exhaust gas passing through the first partition wall. Thus, the exhaust gas passing through the injector nozzle is cleaned, and the air flowing through the injector nozzle is mixed with the exhaust gas cleaning the same of combustion products. The cleaned exhaust gas is then discharged through the second partition wall. The air filter contained in the air supply conduit is preferably configured as an annular filter having a central hole (e.g., circular hole) formed therein. The first partition wall has a number of slots formed therein so that the air flowing through the injector nozzle is divided into a plurality of passages. Thus, the air supplied through the air supply conduit is divided into a plurality of axial flows which impinge upon the outer surface of the annular filter through the holes formed therein, thereby cleaning the air supplied to the injector nozzle. However, in the air filter, as the shape of the central hole (e.g., circular hole) in the annular filter is sharp, the particle size of the solid impurities contained in the air passing through the annular filter is large. Therefore, the area of the central hole (e.g., circular hole) in the annular filter is limited. As a result, it is difficult to ensure a desired filter capacity, and the cleaning ability of the air supplied through the injector nozzle is reduced.
