The aquatic ectotherms *Ambystoma punctatum* and *Rana temporaria* showed vigorous shivering thermogenesis (ST) during the autumn and winter, whereas amphibian choruses and rotations were induced during the spring and summer. We investigated the effects of temperature and illumination on ST by measuring oxygen consumption of these animals. Both the unfed animals and the animals fed for 2 hr showed no significant differences in ST across the temperature gradient between 10 and 27 degrees C. When the fed animals were exposed to light for 3 hr in the light and

dark cycle (light on at 0800, dark at 2000), the oxygen consumption was increased at all temperatures (10-27 degrees C) during the light phase of the cycle, as compared with those during the dark phase. These results suggest that ST may occur during periods of a rapid increase in metabolic activities during the light phase of the light/dark cycle, even 2edc1e01e8
